A Rigorous Method for Computing Geodetic Distance From Shoran Observations
- and Appendixes A-C (Technical Report)

(None)

Kroll, Cedric W.

U. S. Army Corps of Engineers, Army Map Service, Washington, D. C.
(Same)

4

June '50 Restr. U. S. English 25 (None) (Same)

Investigations indicated that the distances measured by means of the Shoran navigation system were short by about 1 part in 20,000. A study was made to discover what portion of this error could be attributed to the method of computation used by the Air Force to obtain geodetic distance from Shoran dial readings and weather observations. The basic theory and assumptions used in computing geodetic distance from Shoran dial readings are outlined, and a hypothetical problem is solved by two methods. Proof is established that mathematical errors due to the use of the Air Force reduction methods are negligible.

A RIGOROUS METHOD FOR COMPUTING
GEODETIC DISTANCE FROM SHORAN OBSERVATIONS

Report as of 20 January 1950

I. SUMMARY

With respect to the Caribbean Area Shoran Project carried out by the 7th Geodetic Control Squadron, investigations indicate that the measured Shoran distances are, on the whole, short by about 1 part in 20,000. It was one of the primary purposes of this study to discover what portion, if any, of this error could be attributed to the method of computation used by the Air Force to obtain geodetic distance from Shoran dial readings and weather observations. The results of this study indicate that the error arising from this source could be in the neighborhood of 1 part in 150,000 for a half-line distance of 250 miles. On the basis of this result other sources of error must be sought, the most probable of which appears to be the value for the velocity of light. This matter is discussed quite thoroughly by Mr. Aslakson of the U. S. Coast and Geodetic Survey (Transactions American Geophysical Union, August, 1949).

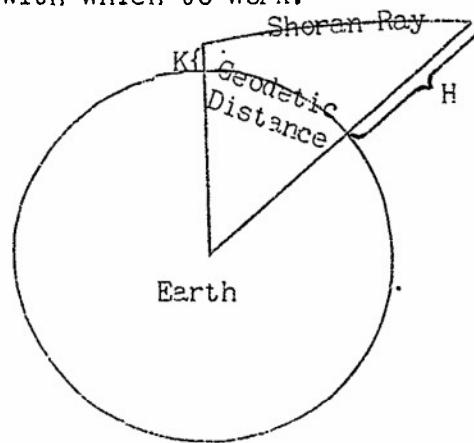

Whether or not this report can be of practical use in future Shoran work it is believed that through it two things of importance have been accomplished:

- (1) A rigorous method of unlimited applicability has been developed.
- (2) Proof has been established that mathematical errors due to the use of the Air Force reduction method are negligible.

II. BASIC PROBLEM AND UNDERLYING ASSUMPTIONS

The simplicity with which the problem of obtaining geodetic distance from Shoran observations can be stated is deceiving. There are given, essentially, four conditions with which to work.

dit

There are known, first, the altitude, H, of the airplane, second, the altitude, K, of a ground station, third, the time, t, required for the Shoran ray to travel from the airplane to the ground station, and fourth, the meteorological conditions existing along the path of the Shoran ray.

The underlying assumptions are as follows:

First, the figure of the earth is represented for the time being by the International Sphere, whose radius, R , is set at 6,371,227 meters or 20,902,933.92 feet.

Second, the Shoran ray is represented by a line which lies in a plane passing through the center of the earth. The geodetic distance is taken as the intersection of this plane with the surface of the earth.

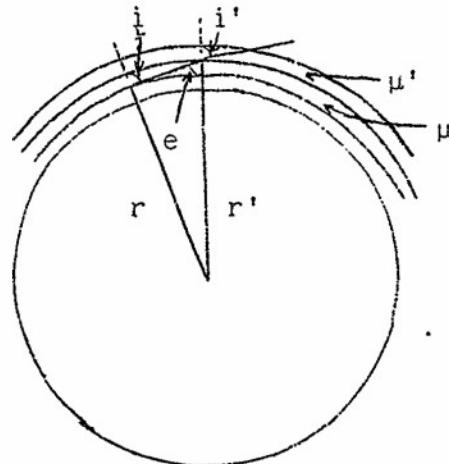

Third, the assumption is made that the Shoran ray is governed by the laws of geometric optics. In justification of this assumption, reference is made to Report No. 447, Radiation Laboratory, Massachusetts Institute of Technology, November, 1943, entitled "The Effect of Atmospheric Refraction on Short Radio Waves."

Fourth, Anderson's 1941 value of 299,776,000 meters per second is used for the velocity of light, V .

Fifth, it is assumed that the velocity of the Shoran ray varies inversely as μ , the index of refraction, which is numerically equal to the square root of the dielectric constant. This point is discussed briefly in an unpublished paper entitled, "Velocity Correction to Shoran Measurements," by Donald A. Rice of the U. S. Coast and Geodetic Survey.

III. THEORY OF SOLUTION

The solution presented here depends on the relation $r\mu \cos \alpha = k$, the proof of which is given below.

The figure represents a spherical earth surrounded by infinitesimally thin spherical layers of atmosphere having different values of μ . A ray, lying in a plane which contains the earth's center, passes through these layers. By the law of sines,

$$\frac{r'}{\sin (180^\circ - i)} = \frac{r}{\sin e} .$$

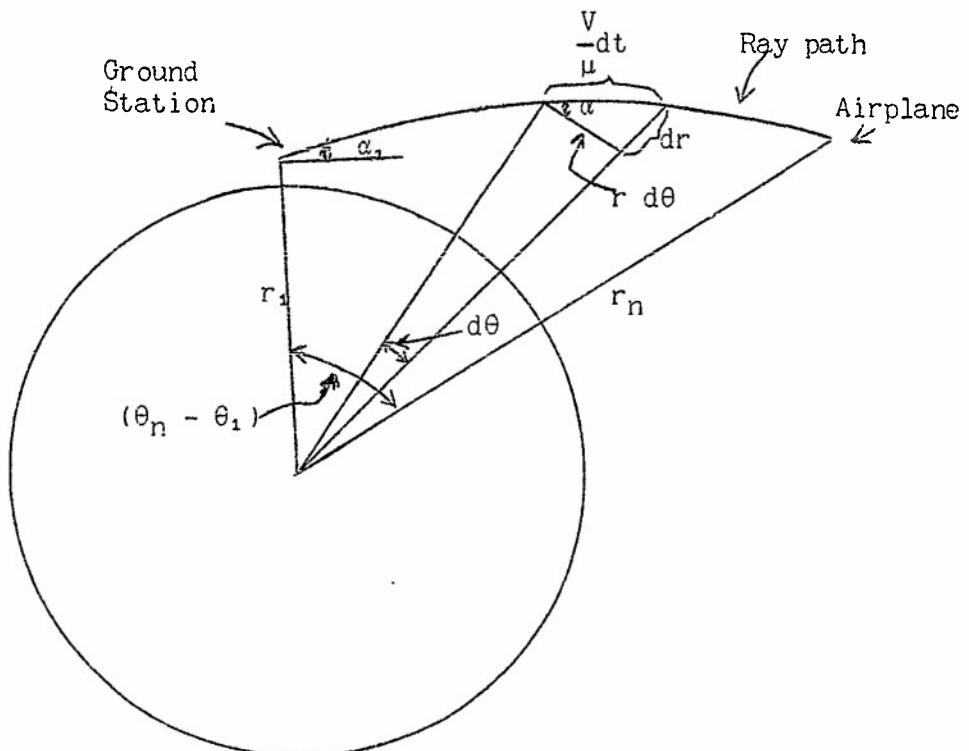

But, by Snell's Law, $\mu' \sin i' = \mu \sin e$, so that

$$\frac{r'}{\sin (180^\circ - i)} = \frac{r}{\frac{\mu'}{\mu} \sin i'}$$

or $r\mu \sin i = r'\mu' \sin i'$.

Since this relation holds between adjacent layers of atmosphere, $r\mu \sin i$ can be represented by a constant for a particular path. In the relation, $r\mu \cos \alpha = k$, α represents the complement of i , and k , a constant value depending on the ray.

The method of solution can be illustrated by means of the figure below.

From the differential triangle constructed on the ray path, the following relations are apparent:

$$\frac{dr}{dt} = \frac{V \sin \alpha}{\mu}$$

$$\frac{d\theta}{dt} = \frac{V \cos \alpha}{r \mu}$$

By Maclaurin's series,

$$r_n = r_1 + t \left(\frac{dr}{dt} \right)_1 + \frac{t^2}{2} \left(\frac{d^2 r}{dt^2} \right)_1 + \dots$$

and

$$\theta_n = \theta_1 + t \left(\frac{d\theta}{dt} \right)_1 + \frac{t^2}{2} \left(\frac{d^2\theta}{dt^2} \right)_1 + \frac{t^3}{6} \left(\frac{d^3\theta}{dt^3} \right)_1 + \dots$$

if t is considered to be zero at the ground station.

Since μ is a function of r , and since $\cos \alpha = \frac{k}{r\mu}$ and $\sin \alpha = \sqrt{1 - \frac{k^2}{r^2\mu^2}}$, both $\frac{dr}{dt}$ and $\frac{d\theta}{dt}$ are functions of r if a value is assumed for k .

Expressions for the derivatives of r and θ can be found in Appendix A. An examination of these derivatives indicates that their evaluation at the ground station requires only the values of r_1 , μ_1 and its derivatives, and α_1 (the assumption of a value for α_1 is, of course, equivalent to the assumption of a value for k). In practice α_1 can be approximated from the triangle whose sides are $(r_1 + 1/3 R)$, $(r_n + 1/3 R)$, and (Vt) . (When r_1 and r_n are increased by $1/3 R$, the ray path, Vt , can, for approximation purposes, be considered as a straight line.) This value for α_1 is then tested in the "r" series to see if it produces r_n . If it produces a value which differs from the given r_n , this erroneous value of r_n can be used to compute a new value for α_1 in the same manner as before and the first value for α_1 can be adjusted by proportion. Usually this adjusted value of α_1 will, when substituted in the "r" series, produce r_n with sufficient accuracy. When, by means of the "r" series, it is shown that the correct value of α_1 has been found, direct substitution in the " θ " series produces the geodetic arc, $\theta_n - \theta_1$. (It is pointed out that in this discussion θ_1 is always equal to zero.)

IV. SOLUTION OF HYPOTHETICAL PROBLEM BY SERIES

The hypothetical problem to be solved has the following conditions. The value of r_1 is 20,903,000.00 feet, the value of r_n is 20,950,702.76 feet, and $t = .0016$ seconds. The atmosphere assumed is known as the NACA "moist" atmosphere. In it, $(\mu - 1) 10^6 = 327.54 - 11.134 46970 h + .12052,34160h^2$, where h = altitude in thousands of feet. It is pointed out that r_n is specially chosen because it is the value produced by the "r" series when $\alpha_1 = 0$. The choice of this value for α_1 is almost essential in order to evaluate the derivatives of r and θ with reasonable ease, and since the purpose of a solution by series is only to verify the accuracy of the more practical numerical integration method, it is felt that the choice of conditions is justified. When $\alpha_1 = 0$ is used in the derivatives of r and θ , all terms vanish except the first of every other derivative.

With the aid of Appendix A, the following solution can be set down.

$$r_1 = 2.0903 00000 \times 10^4 \text{ (in thousands of feet)}$$

$$\mu_1 = 1.0003 26805$$

$$\mu_1^I = -1.1118 54133 \times 10^{-6}$$

$$\mu_1^{II} = 2.4104 68320 \times 10^{-7}$$

(Note: In the following expressions the subscript "1" is omitted.)

$$a = \frac{r\mu^I}{\mu} = -2.3233 49412 \times 10^{-1}$$

$$b = \frac{r^2 \mu^{II}}{\mu} = 1.0528 74877 \times 10^2$$

V. SOLUTION OF HYPOTHETICAL PROBLEM BY NUMERICAL INTEGRATION

In the search for a practical, yet rigorous, method for computing geodetic distance from Shoran observations the method of numerical integration, demonstrated in the computation form below, seems to offer the best possibility.

Here again an approximation to α_1 must be made and then tested to see if it will produce r_n . In the demonstration below, however, the purpose is to produce by numerical integration the same value of $R(\theta_n - \theta_1)$ as was obtained by the "series" method. Therefore the computation was begun with $\alpha_1 = 0$ as before. In actual use, the trial computation of r_n using an approximated value of α_1 would utilize every column on the form except that for $\frac{1}{r^2 \mu^2}$, which is used only in the computation of $\theta_n - \theta_1$.

An examination of the first two lines of the form reveals that the "series" method of Section IV has been used to produce r_2 and r_3 . Since the interval, Δt , is small only two derivatives are required on each line. By reference to the values of the derivatives in the solution of Section IV it is easy to determine the limiting value of Δt that can be used in the first two lines of the computation. To limit the error to .01 feet Δt can be found from the relation

$$\frac{(\Delta t)^4}{4!} \frac{d^4 r}{dt^4} = .00001 \text{ (in thousands of feet)} = (\Delta t)^4 3.3959 \times 10^{11} = .00001$$

From this equation $\Delta t =$ about .00007. Of course, this is the limiting value under a particular set of conditions. In the numerical integration below, the interval $\Delta t = .00002$ was used to produce r_2 , r_3 , r_4 , and r_5 .

Thereafter the interval was doubled to reduce the labor of computation. In the examples of Appendix B and Appendix C, the interval $\Delta t = .00002$ was used throughout. It is obvious that in an erratic atmosphere the intervals must necessarily be small, while in a smoothly changing atmosphere the intervals can be quite large.

On the form below, the first value of r is the starting value r_1 . As explained above, the values r_2 and r_3 are found by the "series" method. The value of r_4 is found by integrating the second degree function determined by $(\frac{dr}{dt})_1$, $(\frac{dr}{dt})_2$, and $(\frac{dr}{dt})_3$. The values of r_5 , r_6 , etc., are found in a similar manner from the $\frac{dr}{dt}$'s from the three preceding lines. A discussion of this technique can be found in Whittaker and Robinson's "Calculus of Observations."

Briefly, however, the step by step relationship can be explained as follows.

The increase in r during any fraction, ϵ , of the n th time interval, Δt , can be expressed as

$$r_n + \epsilon - r_n = \Delta t \int_0^\epsilon \left(\frac{dr}{dt} \right)_{n+\epsilon} d\epsilon$$

But $\left(\frac{dr}{dt} \right)_{n+\epsilon} = E^\epsilon \left(\frac{dr}{dt} \right)_n = \left(1 - \frac{\Delta}{E} \right)^{-\epsilon} \left(\frac{dr}{dt} \right)_n$

$$= \left\{ 1 + \epsilon \left(\frac{\Delta}{E} \right) + \frac{\epsilon(\epsilon+1)}{2} \left(\frac{\Delta}{E} \right)^2 \right\} \left(\frac{dr}{dt} \right)_n \text{ to second differences,}$$

where the operator E can be defined by the following,

$$E^n f(x)_0 = (1 + \Delta)^n f(x)_0 = f(x)_n.$$

When $\epsilon = 1$

$$\begin{aligned} r_{n+1} - r_n &= \Delta t \int_0^1 \left\{ 1 + \epsilon \left(\frac{\Delta}{E} \right) + \frac{\epsilon(\epsilon+1)}{2} \left(\frac{\Delta}{E} \right)^2 \right\} \left(\frac{dr}{dt} \right)_n d\epsilon \\ &= \Delta t \left[\int_0^1 \left\{ \epsilon + \frac{\epsilon^2}{2} \left(\frac{\Delta}{E} \right) + \left(\frac{\epsilon^3}{6} + \frac{\epsilon^2}{4} \right) \left(\frac{\Delta}{E} \right)^2 \right\} \left(\frac{dr}{dt} \right)_n \right] \\ &= \Delta t \left\{ \left(\frac{dr}{dt} \right)_n + \frac{1}{2} \Delta \left(\frac{dr}{dt} \right)_{n-1} + \frac{5}{12} \Delta^2 \left(\frac{dr}{dt} \right)_{n-2} \right\} \end{aligned}$$

Representing $\Delta t \left(\frac{dr}{dt} \right)_n$ by q_n , we have,

$$r_{n+1} - r_n = q_n + .5\Delta q_{n-1} + .417 \Delta^2 q_{n-2}$$

Because $\Delta^2 q_{n-2}$ is small in value, its coefficient is expressed to only three decimals. When the Δ 's in this expression are replaced by their equivalents,

$$r_{n+1} - r_n = 1.917 q_n - 1.334 q_{n-1} + .417 q_{n-2}$$

When t does not contain exactly an integral number of Δt 's, the change in r during the fractional portion of the last Δt can be found by using the

general form of the above and integrating between 0 and ϵ instead of between 0 and 1. However, this resort is seldom required since t can always be divided into an integral number of equal intervals.

A few remarks concerning the actual computation of the attached example may be of help. Except for the last column the computation proceeds from line to line. The "h" on each line is equal to $r - R$ and is obtained merely for use with a graph of μ 's against h . The " μ " on each line is obtained from such a graph. The computation of "q" can be accomplished without writing down any intermediate answers. The complement of $\frac{k^2}{r^2 \mu^2}$ is gotten first in the top dial. The square root of this result is multiplied by $V\Delta t$ (constant throughout the calculation, except when the interval is changed) and divided by μ . The values of μ^1 required in the first two lines can be found by fitting a polynomial to a few points of the " μ " curve. A number of techniques, any of which will produce good results, can be used to obtain these values. The first few values of r are produced numerically below to indicate more clearly the steps to be taken.

$$\begin{aligned} 20903.00000 &= \text{given starting value of } r \\ 20903.00710 &= 20903.00000 + .00000 + .00710 \\ 20903.02781 &= 20903.00710 + .01361 + .00710 \\ 20903.06381 &= 20903.02781 + 1.917(.02825) - 1.334(.01361) + .417(.00000) \\ 20903.11358 &= 20903.06381 + 1.917(.04266) - 1.334(.02825) + .417(.01361) \\ \text{etc.} & \end{aligned}$$

Attention is directed to the value of k shown at the top of the computation form. Since $\cos \alpha_1 = 1$ in this particular computation, $k = r_1 \mu_1$. In most cases, however, $\cos \alpha_1$ will have a value different from 1 in the expression, $k = r_1 \mu_1 \cos \alpha_1$.

The procedure for obtaining θ is relatively simple. Since $\frac{d\theta}{dt} = \frac{V \cos \alpha}{r \mu}$
 $= \frac{V k}{r^2 \mu^2}$, it is only necessary to tabulate $\frac{1}{r^2 \mu^2}$ for each step. The relation between θ_{n+1} and θ_n is alike in form to that between r_{n+1} and r_n , i.e.,

$$\theta_{n+1} - \theta_n = \Delta t \left(1.917 \frac{V k}{(r \mu)_n^2} - 1.334 \frac{V k}{(r \mu)_{n-1}^2} + .417 \frac{V k}{(r \mu)_{n-2}^2} \right)$$

If $\frac{1}{(r \mu)_n^2}$ is replaced by p_n , then

$$\theta_{n+1} - \theta_n = \Delta t V k (1.917 p_n - 1.334 p_{n-1} + .417 p_{n-2})$$

It is seen that $\theta_4 - \theta_3$, $\theta_5 - \theta_4$, $\theta_6 - \theta_5$, etc., can be obtained immediately from p_1 , p_2 , p_3 , etc. To get values for $\theta_3 - \theta_2$, $\theta_2 - \theta_1$ however, the relationship above can be applied in reverse. That is,

$$\begin{aligned} \theta_2 - \theta_1 &= \Delta t V k (1.917 p_2 - 1.334 p_3 + .417 p_4) \\ \text{and } \theta_3 - \theta_2 &= \Delta t V k (1.917 p_3 - 1.334 p_4 + .417 p_5) \end{aligned}$$

By means of the following arrangement, the form of $\theta_n - \theta_1$ (the total angle produced by t) can be shown.

$$\begin{aligned}
 \theta_2 - \theta_1 &= \Delta t V k (+ 1.917 p_2 - 1.334 p_3 + .417 p_4) \\
 \theta_3 - \theta_2 &= \Delta t V k (+ 1.917 p_3 - 1.334 p_4 + .417 p_5) \\
 \theta_4 - \theta_3 &= \Delta t V k (+ .417 p_4 - 1.334 p_2 + 1.917 p_3) \\
 \theta_5 - \theta_4 &= \Delta t V k (+ .417 p_5 - 1.334 p_3 + 1.917 p_4) \\
 \theta_6 - \theta_5 &= \Delta t V k (+ .417 p_6 - 1.334 p_4 + 1.917 p_5) \\
 \theta_7 - \theta_6 &= \Delta t V k (+ .417 p_7 - 1.334 p_5 + 1.917 p_6) \\
 \text{etc.}
 \end{aligned}$$

From this arrangement

$$\begin{aligned}
 \theta_n - \theta_1 &= \Delta t V k (.417 p_1 + p_2 + 1.583 p_3 + .083 p_4 + 1.417 p_5 + p_6 + p_7 + p_8 + \dots \\
 &\quad + p_{n-3} + .583 p_{n-2} + 1.917 p_{n-1})
 \end{aligned}$$

This expression is applicable to the computations in Appendix B and C. In the form immediately below, however, a slightly different procedure was followed. In each of the first four intervals Δt was taken as .00002 and in each interval thereafter it was taken as .00004.

The value of q_1 was found by multiplying $\left(\frac{dr}{dt}\right)_1$ by .00002. The values of q_2 , q_3 , and q_4 were found in the same manner. The value of q_5 was found by multiplying $\left(\frac{dr}{dt}\right)_5$ by .00004. The remaining q 's were also found by multiplying by .00004. The following relationships were then used:

$$\begin{aligned}
 r_4 - r_3 &= 1.917 q_3 - 1.334 q_2 + .417 q_1 \\
 r_5 - r_4 &= 1.917 q_4 - 1.334 q_3 + .417 q_2 \\
 r_6 - r_5 &= 1.917 q_5 - 2(1.334) q_4 + 2(.417) q_3 \\
 r_7 - r_6 &= 1.917 q_6 - 1.334 q_5 + 2(.417) q_4 \\
 r_8 - r_7 &= 1.917 q_7 - 1.334 q_6 + .417 q_5
 \end{aligned}$$

For the remaining lines the relationship is similar to that between r_6 and r_7 .

The computation of $\theta_n - \theta_1$ in this particular problem is based on the following arrangement:

$$\begin{aligned}
 \theta_2 - \theta_1 &= .00002 V k (+ 1.917 p_2 - 1.334 p_3 + .417 p_4) \\
 \theta_3 - \theta_2 &= .00002 V k (+ 1.917 p_3 - 1.334 p_4 + .417 p_5) \\
 \theta_4 - \theta_3 &= .00002 V k (+ .417 p_4 - 1.334 p_2 + 1.917 p_3) \\
 \theta_5 - \theta_4 &= .00002 V k (+ .417 p_5 - 1.334 p_3 + 1.917 p_4) \\
 \theta_6 - \theta_5 &= .00004 V k (+ .417 p_6 - 1.334 p_5 + 1.917 p_6) \\
 \theta_7 - \theta_6 &= .00004 V k (+ .417 p_7 - 1.334 p_6 + 1.917 p_7) \\
 \theta_8 - \theta_7 &= .00004 V k (+ .417 p_8 - 1.334 p_7 + 1.917 p_8) \\
 \text{etc.}
 \end{aligned}$$

Therefore

$$\begin{aligned}
 \theta_n - \theta_1 &= .00004 V k (.6255 p_1 + .5 p_2 - .334 p_3 + .5 p_4 + 1.2085 p_5 + p_6 + p_7 + \dots \\
 &\quad + p_{n-3} + .583 p_{n-2} + 1.917 p_{n-1})
 \end{aligned}$$

SECTION V

Numerical integration solution of problem presented in section IV.

$$K = r_1 \mu_1 = 20909.83110$$

$$K^2 = 437.2210366 \times 10^6$$

$$\theta_n - \theta_1 = VK\Delta t [913.725700441640 \times 10^{-10}] = [983,515.0932] [20,909.83110] [.00004] [913.7257004 \times 10^{-10}] = .07516356763$$

$$S = R[\theta_n - \theta_1] = 297.5642211 \text{ miles}$$

VI. SOLUTION OF HYPOTHETICAL PROBLEM BY AIR FORCE METHOD

Since the Air Force tables are not constructed to handle a ray which attains the height and length of the one treated in Sections IV and V, that problem has been modified by reducing t from .0016 to .0014 seconds. In the "series" of Section IV it is a simple matter to substitute this new value of t and produce $r_n = 20,939,111.80$ feet and $R(\theta_n - \theta_1) = 260.45172$ miles. Since the velocity of propagation is assumed to be 186,219 mps in the Shoran instrument, the dial reading would be 260.70660 miles. Thus the basic values in the Air Force notation are as follows:

$$\begin{aligned} K &= 66.08 \text{ feet} \\ H &= 36,177.88 \text{ feet} \\ (H - K) &= 36,111.80 \text{ feet} \\ S &= 260.70660 \text{ miles} \end{aligned}$$

Of course, the NACA standard "moist" atmosphere is used as before. Since μ is a smoothly changing value, it would seem to conform with Air Force procedure to use intervals of about 1300 feet when computing the velocity correction.

The results of the entire computation appear below:

Dial reading	260.70660
Velocity correction	+ .01641
Reduction to sea level	- .22602
Slope correction	- .08971
Curvature correction	+ .04403
Steep slope correction	- .00002
Assumption I	+ .00010
" VII	- .00015
" VIII	+ .00200
" IX	+ .00019
" X	- .00010

Geodetic distance by Air Force method = 260.45333

This result is 8.50 feet in excess of the result obtained by means of series.

VII. DISCUSSION

A comparison of the distance produced by the series solution of Section IV with the distance found through the numerical integration solution of Section V is believed to establish the validity of the latter method. Of course, it is realized that the " μ " curve used in the solution of this particular problem was extremely smooth. It is believed, however, that the method is valid in any case where a reasonable amount of smoothing has been carried out before the " μ " values are used in the integration. In considering the possible roughness that can occur in the " μ " curve, it was thought safer to project on the basis of a second degree curve formed by three values of $\frac{dr}{dt}$, than to project on the basis of a $\frac{dr}{dt}$ curve of higher degree. If small intervals of Δt are used, it is difficult to see how any serious error can occur.

The application of the numerical integration method and the Air Force method to three different problems produced the following distances in miles:

Problem	Air Force Formula	Numerical Integration	Air Force minus Numerical Integration
Section VI	260.45333	260.45172	+ .00161
Appendix B	152.52686	152.52683	+ .00003
Appendix C	100.49874	100.49872	+ .00002

In an attempt to analyze the cause for the difference in the results, a study was made of the height of the ray path used in the problem of Section VI. Below is given a table comparing heights obtained from the numerical integration curve with those obtained from the Air Force formula,

$$h = K + \frac{M_1(H - K)}{M} - .496M_1(M - M_1)$$

M_1 (distance in miles)	Height of ray path in feet		
	Air Force Formula	Numerical Integration	Air Force minus Numerical Integration
0.0000	66.08	66.08	0.00
48	1663.26	1254.12	409.14
70	3159.14	2588.34	570.80
87	4643.90	3963.74	680.16
101	6081.90	5326.01	755.89
113	7469.23	6655.05	814.18
124	8866.44	8014.04	852.40
134	10240.78	9353.70	887.08
144	11714.33	10815.53	898.80
152	12964.59	12059.32	905.27
161	14447.02	13542.46	904.56
169	15832.19	14936.26	895.93
176	17096.30	16216.14	880.16
183	18409.01	17551.54	857.47
190	19770.34	18942.89	827.45
197	21180.27	20390.60	789.67
204	22638.81	21895.16	743.65
210	23927.67	23228.37	699.30
216	25252.25	24601.78	650.47
222	26612.53	26027.31	585.22
228	28008.53	27495.01	513.52
234	29440.24	29003.96	436.28
239	30660.62	30289.71	370.91
244	31905.79	31613.67	292.12
250	33432.73	33243.19	189.54
255	34732.47	34631.98	100.49
260	36057.00	36049.13	7.87
260.4517	36177.88	36177.17	0.71

The velocity correction given in Section VI was obtained from the Air Force values in this table. If the velocity correction is recomputed using the numerical integration ray path heights it is found to be .01516 miles instead of .01641, which appears to account for .00125 miles of the .00161 mile difference occurring on the 260 mile line. The remaining .00036 miles by which the Air Force result exceeds the numerical integration result is probably caused by the difference in radius of curvature of the Shoran beam.

between the two methods. Simple calculations indicate that variation in the radius of the Shoran beam has relatively little effect on the computed distance. The difference in distance produced by a 260 mile arc of radius 4R as against 5R is only about .0010 miles. The difference in distance produced by the same arc having a radius of 5R as against 6R is about .0006 miles.

It is believed that greater harm is caused by using erroneous values for the height of the ray path when computing the velocity correction, than is caused by the use of the wrong radius in the geometrical solution. However, in actual practice, the effect of both these errors appears to be negligible.

Although numerical integration cannot be considered as a substitute for the Air Force method, at least not until the availability of the electronic computer, it does make possible the construction of ray path curves for varying conditions. It is hoped that through its use, the technique of computing geodetic distances from Shoran observations will be improved.

APPENDIX A

Derivatives of r and θ with respect to t

A (i)

In the derivatives given below, the following substitutions have been used:

$$A = \frac{V}{r\mu}$$

$\mu^I, \mu^{II}, \mu^{III},$ etc., represent the derivatives of μ with respect to r

$$a = \frac{r\mu^I}{\mu}, b = \frac{r^2\mu^{II}}{\mu}, c = \frac{r^3\mu^{III}}{\mu}, d = \frac{r^4\mu^{IV}}{\mu}, \text{ etc.}$$

$$m = a + 1$$

$$m^I = a + b - a^2$$

$$m^{II} = a + 3b + c - 3a^2 + 2a^3 - 3ab$$

$$m^{III} = a + 7b + 6c + d - 7a^2 + 12a^3 - 6a^4 - 3b^2 - 18ab - 4ac + 12a^2b$$

$$m^{IV} = a + 15b + 25c + 10d + e - 15a^2 + 50a^3 - 60a^4 + 24a^5 - 30b^2 - 75ab - 40ac - 5ad + 120a^2b - 60a^3b + 20a^2c + 30ab^2 - 10bc$$

$$m^V = a + 31b + 90c + 65d + 15e + f - 31a^2 + 180a^3 - 390a^4 + 360a^5 - 120a^6 - 270ab - 260ac - 75ad - 6ae - 150bc - 15bd + 780a^2b - 900a^3b + 360a^4b + 300a^2c + 30a^2d - 120a^3c - 270a^2b^2 + 120abc - 195b^2 + 30b^3 - 10c^2 + 450ab^2$$

DISTRIBUTION LIST

All addresses listed in Parts A; C; and ^{D G} X of the ANAF/GM Mailing List
No. 10, GM 66/26, 15 January 1950.

Chief of Engrs., U. S. Army, Washington 25, D. C., Attn: Engr. Organization & Trng. Div.	1
Attn: Engr. Int. Div.	2
The President, AFF Board No. 1, Ft. Bragg, N. C.	2
The President, AFF Board No. 2, Ft. Knox, Ky.	1
Director of Logistics, General Staff, U. S. Army, Washington, 25, D. C. Attn: Research & Development Group.	1
Director of Intelligence, General Staff, U. S. Army, Washington 25, D. C. Attn: Map & Photo Branch.	1
Commanding Officer, Aerohautical Chart Service, U. S. Air Force, Washington 25, D. C.	2
Director of Organization & Trng., General Staff, U. S. Army, Washington 25, D. C.	1
Photographic & Survey Section, Joint Int. Group, Joint Chiefs of Staff, Washington 25, D. C.	1
The Hydrographer, Hydrographic Office, U. S. Navy, Washington 25, D. C.	1
Commanding General, 2nd Air Force, Barksdale Air Force Base, La. . .	1
The Commandant, U. S. Mil. Academy, West Point, N. Y., Attn: Dept. of Mil. Topography & Graphics	1
The Commandant, The Engr. School, Ft. Belvoir, Va., Attn: Librarian	2
The Engineer, Far East Command, APO 500, c/o Postmaster, San Francisco, California.	2
Commanding General, U. S. Army, Caribbean, APO 834, c/o Postmaster, New Orleans, La., Attention: Director, IAGS	1
Commanding Officer, Engr. Research & Development Laboratories, Ft. Belvoir, Va.	2
Chief of Engineers, U. S. Army, Washington 25, D. C., Attn: Engr. Int. Div.	5
